[Postman Collection \(API\)](#)

Admin Flow

If you’re wearing the admin hat, this is your map. The [Admin Flow diagram](#) gives a big-picture view of how an administrator signs in, manages participants, and oversees the challenge lifecycle. Skim it first to get oriented, then jump into the guides below for the how-to details.

A visual walkthrough of the typical admin journey.

Backend Developer Guide (PDF)

Building or debugging the API? Start here. The [Backend Developer Guide](#) covers local setup, environment configuration, core endpoints, and common workflows. It’s the practical companion for getting the server running, testing routes, and understanding how requests are authenticated and validated.

Tip: Pair this with the Postman collection below to poke at endpoints quickly.

Frontend Developer Guide (PDF)

Working on the UI? The [Frontend Developer Guide](#) walks through local development, project structure, environment variables, and how to run tests. It's great for getting a dev server up, understanding routing and components, and shipping changes with confidence.

Frontend & Backend Testing (Markdown)

Curious how we test things end-to-end? Check out [frontend-and-backend-testing.md](#) for a conversational overview of testing tools, what gets covered at each layer, and how to run tests locally.

Reading note: Markdown previews nicely on Git platforms. Locally, open it in a code editor with Markdown preview.

Postman Collection (API)

Want to try the API without writing a single line of code? Import the [Postman collection](#) and you're off to the races.

Fast path: `Postman` → `Import` → pick `docs/backend-postman/postman_collection.json` → set `baseUr1` if needed → send requests. The "Login (set token)" request stores a bearer token for you so authenticated routes work right away.
